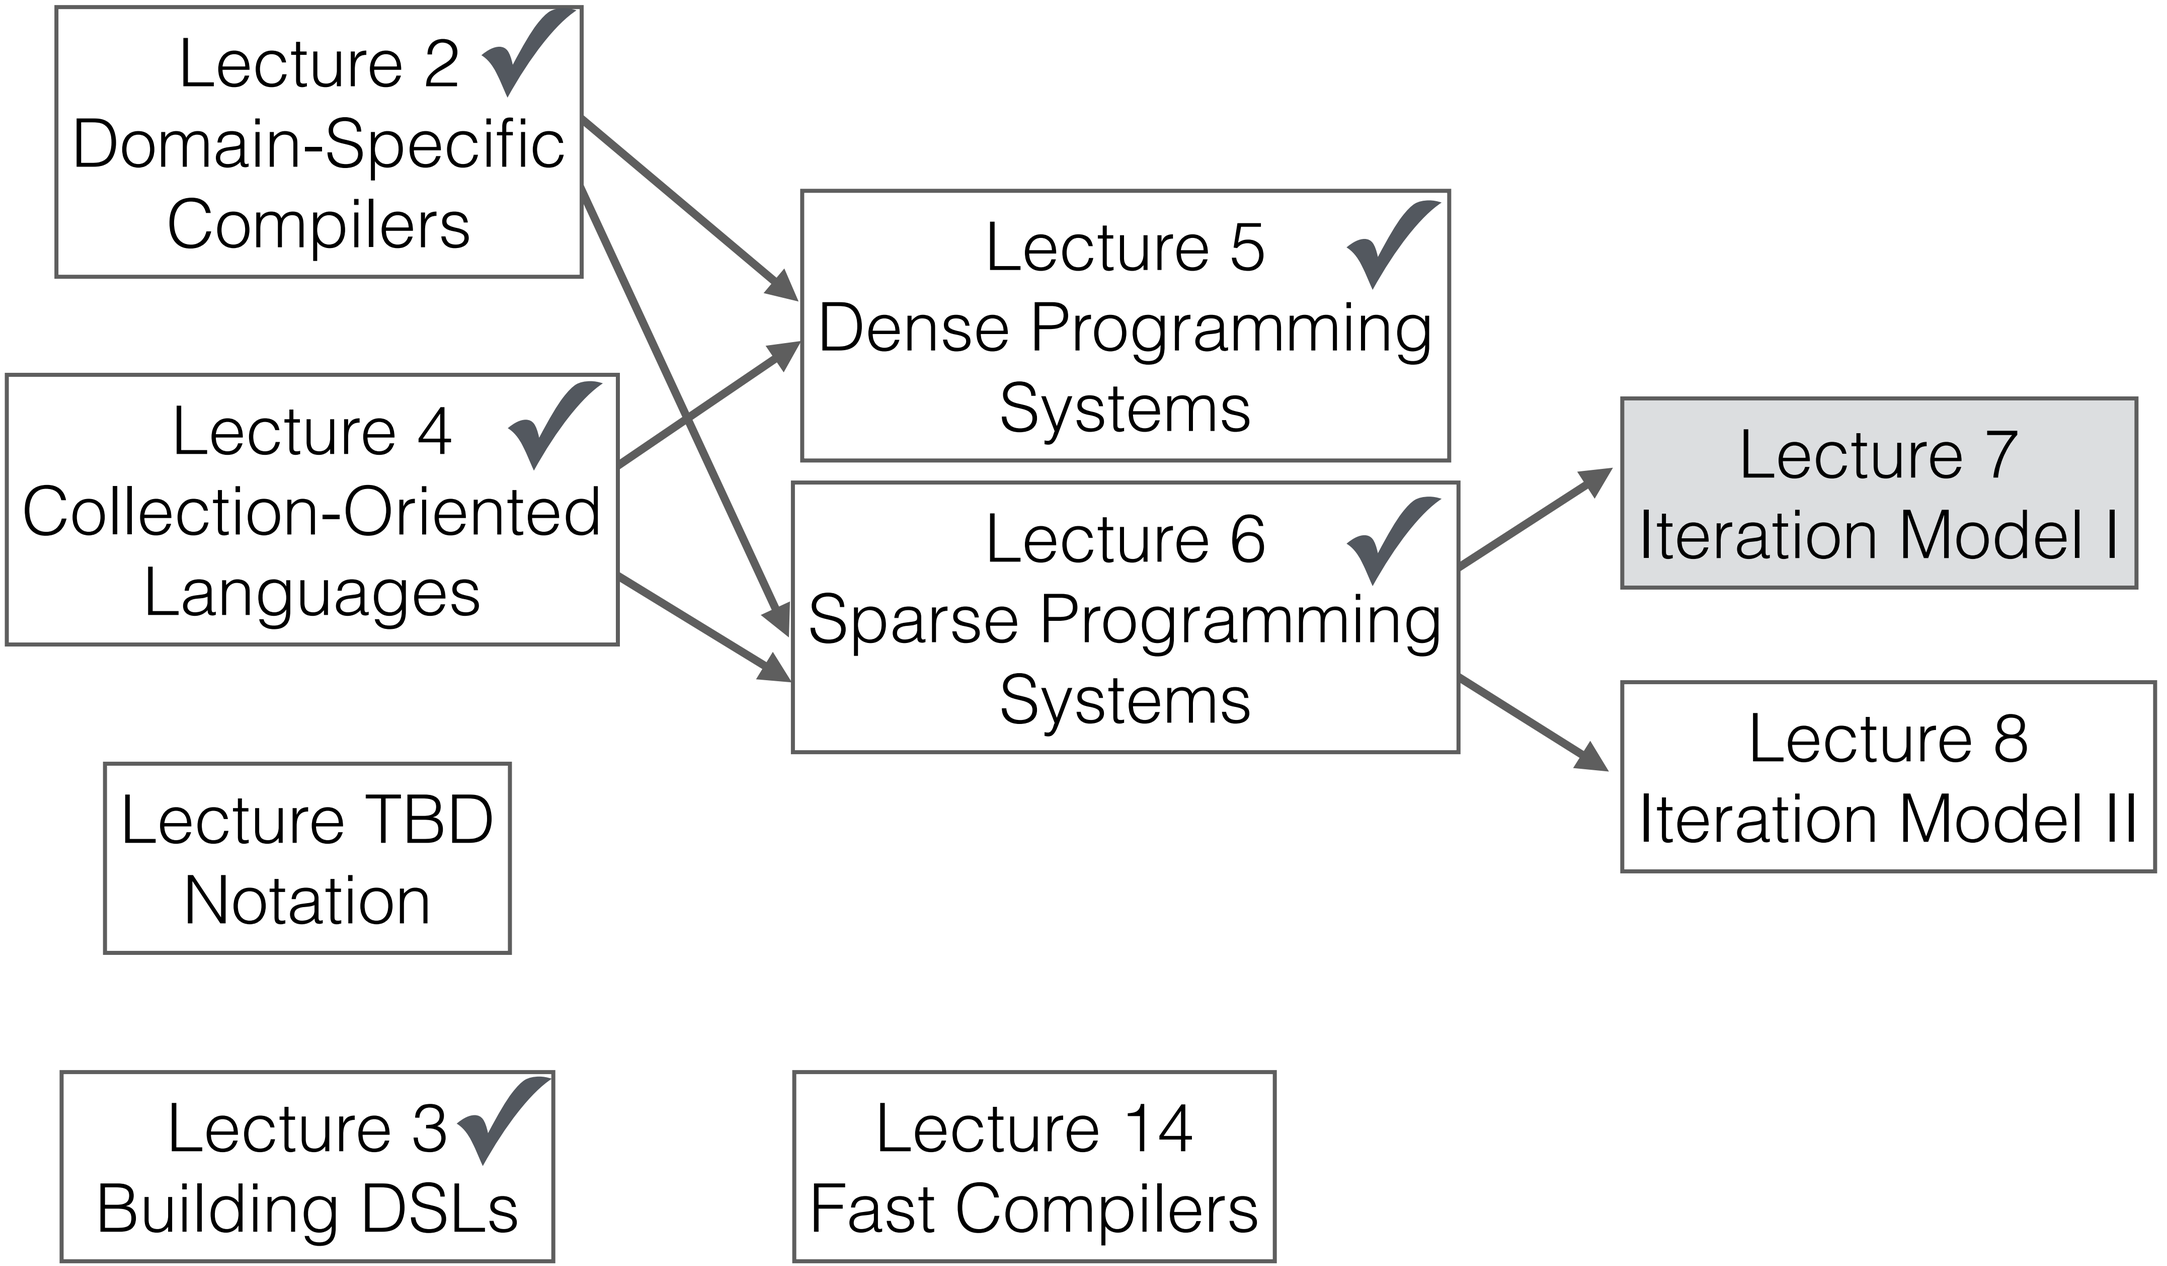
Lecture Overview



Overview of topics

Lecture 7

- Data representation
- Iteration spaces
- Iteration graph IR
- Iteration lattices to represent coiteration

Lecture 8

- Concrete index notation IR
- Code generation algorithm
- Derived iteration spaces
- Optimizing transformations

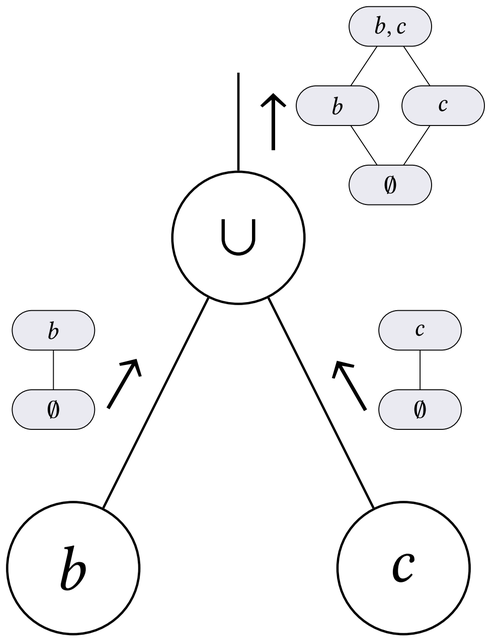
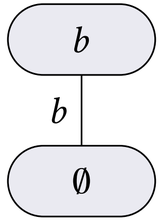
Iteration lattice construction



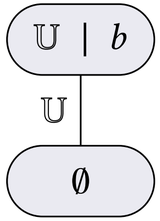
$$b_i \cup c_i$$

Bottom-up construction from set expression:
create and merge iteration lattices

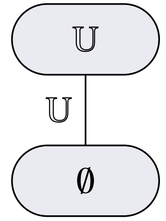
Base cases:



b has an iterator

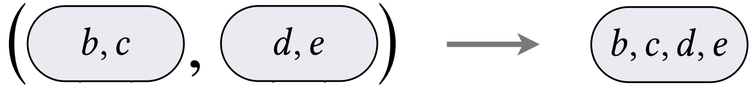


b does not have an iterator,
but supports locate



b is the set universe

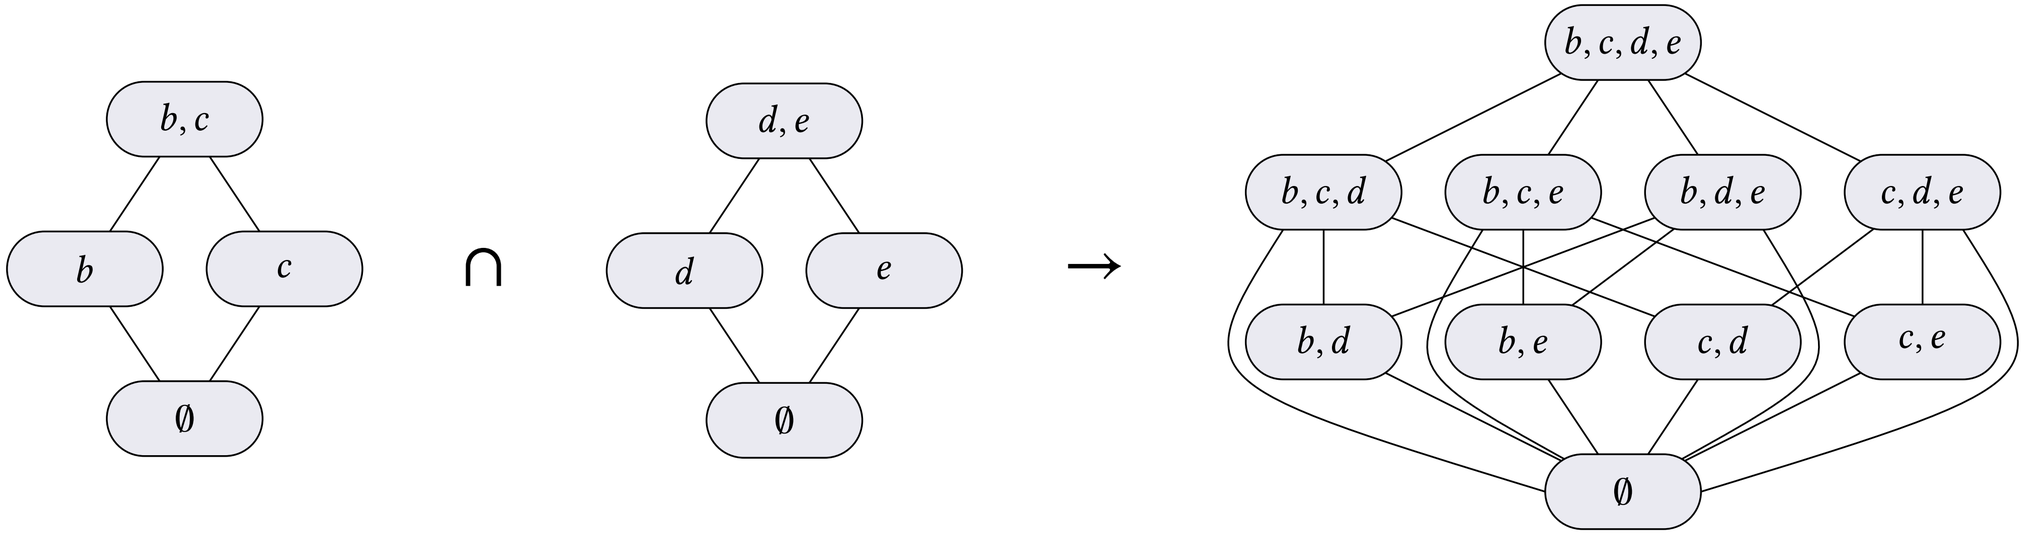
Lattice point merging:



Lattice points are merged by
taking the union of their iterator
and locator sets respectively

Iteration lattice construction

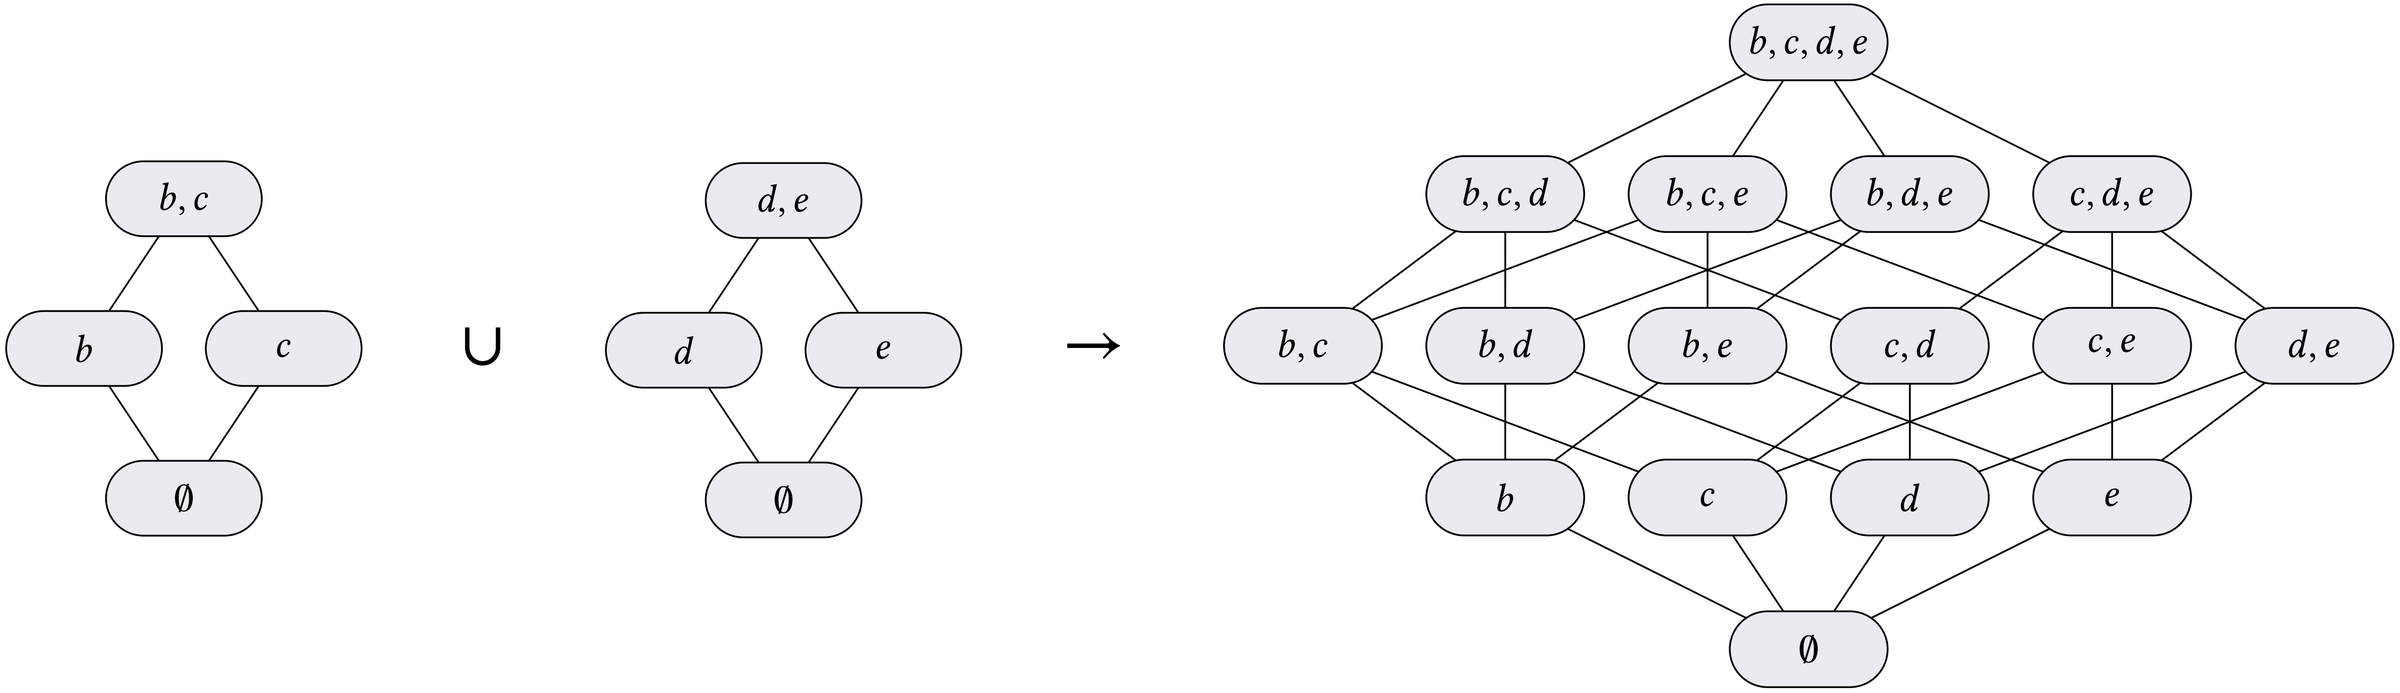
Intersection



The intersection of two lattices is computed by merging the lattice point pairs in the Cartesian combination of their lattice points.

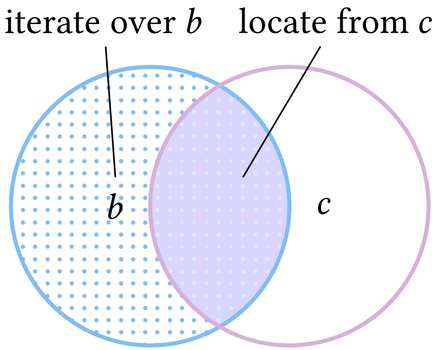
Iteration lattice construction

Union

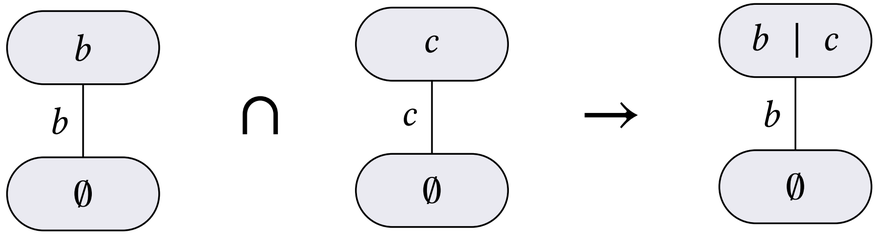


The union of two lattices is computed by first merging the lattice point pairs in the Cartesian combination of their lattice points. The union of the lattices is then the union of the result and the two initial lattices.

Iteration lattice optimization example



Intersection Optimization



When intersecting two lattices, move the operands with the locate capability from one side of the intersection from the iterators to the locators set.
